

Pipeline Syntax

This section builds on the information introduced in [Getting Started](#), and should be treated solely as a reference. For more information on how to use Pipeline syntax in practical examples, refer to [The Jenkinsfile](#) section of this chapter. As of version 2.5 of the Pipeline plugin, Pipeline supports two discrete syntaxes which are detailed below. For the pros and cons of each, see the [Syntax Comparison](#).

As discussed in [Getting Started](#), the most fundamental part of a Pipeline is the "step." Basically, steps tell Jenkins *what* to do, and serve as the basic building block for both Declarative and Scripted Pipeline syntax.

For an overview of available steps, please refer to the [Pipeline Steps reference](#) which contains a comprehensive list of steps built into Pipeline as well as steps provided by plugins.

Declarative Pipeline

Declarative Pipeline is a relatively recent addition to Jenkins Pipeline [19: Version 2.5 of the "Pipeline plugin" introduces support for Declarative Pipeline syntax] which presents a more simplified and opinionated syntax on top of the Pipeline sub-systems.

All valid Declarative Pipelines must be enclosed within a `pipeline` block, for example:

```
pipeline {
    /* insert Declarative Pipeline here */
}
```

The basic statements and expressions which are valid in Declarative Pipeline follow the same rules as [Groovy's syntax](#) with the following exceptions:

- The top-level of the Pipeline must be a *block*, specifically: `pipeline { }`
- No semicolons as statement separators. Each statement has to be on its own line
- Blocks must only consist of [Sections](#), [Directives](#), [Steps](#), or assignment statements.
- A property reference statement is treated as no-argument method invocation. So for example, `input` is treated as `input()`

Sections

Sections in Declarative Pipeline typically contain one or more [Directives](#) or [Steps](#).

agent

The `agent` section specifies where the entire Pipeline, or a specific stage, will execute in the Jenkins environment depending on where the `agent` section is placed. The section must be defined at the top-level inside the `pipeline` block, but stage-level usage is optional.

Required	Yes
Parameters	Described below
Allowed	In the top-level <code>pipeline</code> block and each <code>stage</code> block.

Parameters

In order to support the wide variety of use-cases Pipeline authors may have, the `agent` section supports a few different types of parameters. These parameters can be applied at the top-level of the `pipeline` block, or within each `stage` directive.

any

Execute the Pipeline, or stage, on any available agent. For example: `agent any`

none

When applied at the top-level of the `pipeline` block no global agent will be allocated for the entire Pipeline run and each `stage` section will need to contain its own `agent` section. For example: `agent none`

label

Execute the Pipeline, or stage, on an agent available in the Jenkins environment with the provided label. For example: `agent { label 'my-defined-label' }`

node

`agent { node { label 'labelName' } }` behaves the same as `agent { label 'labelName' }`, but `node` allows for additional options (such as `customWorkspace`).

docker

Execute the Pipeline, or stage, with the given container which will be dynamically provisioned on a `node` pre-configured to accept Docker-based Pipelines, or on a node matching the optionally defined `label` parameter. `docker` also optionally accepts an `args` parameter which may contain arguments to pass directly to a `docker run` invocation, and an `alwaysPull` option, which will force a `docker pull` even if the image name is already present. For example: `agent { docker 'maven:3-alpine' }` or

```
agent {
  docker {
    image 'maven:3-alpine'
    label 'my-defined-label'
    args '-v /tmp:/tmp'
  }
}
```

dockerfile

Execute the Pipeline, or stage, with a container built from a `Dockerfile` contained in the source repository. In order to use this option, the `Jenkinsfile` must be loaded from either a Multibranch Pipeline, or a "Pipeline from SCM." Conventionally this is the `Dockerfile` in the root of the source repository: `agent { dockerfile true }`. If building a `Dockerfile` in another directory, use the `dir` option: `agent { dockerfile { dir 'someSubDir' } }`. You can pass additional arguments to the `docker build` ... command with the `additionalBuildArgs` option, like `agent { dockerfile { additionalBuildArgs '--build-arg foo=bar' } }`.

Common Options

These are a few options that can be applied two or more `agent` implementations. They are not required unless explicitly stated.

label

A string. The label on which to run the Pipeline or individual `stage`.

This option is valid for `node`, `docker` and `dockerfile`, and is required for `node`.

customWorkspace

A string. Run the Pipeline or individual **stage** this **agent** is applied to within this custom workspace, rather than the default. It can be either a relative path, in which case the custom workspace will be under the workspace root on the node, or an absolute path. For example:

```
agent {
  node {
    label 'my-defined-label'
    customWorkspace '/some/other/path'
  }
}
```

This option is valid for **node**, **docker** and **dockerfile**.

reuseNode

A boolean, false by default. If true, run the container on the node specified at the top-level of the Pipeline, in the same workspace, rather than on a new node entirely.

This option is valid for **docker** and **dockerfile**, and only has an effect when used on an **agent** for an individual **stage**.

Example

```
// Declarative //
pipeline {
  agent { docker 'maven:3-alpine' } ①
  stages {
    stage('Example Build') {
      steps {
        sh 'mvn -B clean verify'
      }
    }
  }
}
// Script //
```

- ① Execute all the steps defined in this Pipeline within a newly created container of the given name and tag (**maven:3-alpine**).

Stage-level **agent** section

```
// Declarative //
pipeline {
  agent none ❶
  stages {
    stage('Example Build') {
      agent { docker 'maven:3-alpine' } ❷
      steps {
        echo 'Hello, Maven'
        sh 'mvn --version'
      }
    }
    stage('Example Test') {
      agent { docker 'openjdk:8-jre' } ❸
      steps {
        echo 'Hello, JDK'
        sh 'java -version'
      }
    }
  }
}
// Script //
```

- ❶ Defining **agent none** at the top-level of the Pipeline ensures that **an Executor** will not be assigned unnecessarily. Using **agent none** also forces each **stage** section contain its own **agent** section.
- ❷ Execute the steps in this stage in a newly created container using this image.
- ❸ Execute the steps in this stage in a newly created container using a different image from the previous stage.

post

The **post** section defines one or more additional **steps** that are run upon the completion of a Pipeline's or stage's run (depending on the location of the **post** section within the Pipeline). **post** can support one of the following **post-condition** blocks: **always**, **changed**, **failure**, **success**, **unstable**, and **aborted**. These condition blocks allow the execution of steps within the **post** section depending on the completion status of the Pipeline or stage.

Required	No
Parameters	<i>None</i>
Allowed	In the top-level pipeline block and each stage block.

Conditions

always

Run the steps in the **post** section regardless of the completion status of the Pipeline's or stage's run.

changed

Only run the steps in **post** if the current Pipeline's or stage's run has a different completion status from its previous run.

failure

Only run the steps in **post** if the current Pipeline's or stage's run has a "failed" status, typically denoted by red in the web UI.

success

Only run the steps in **post** if the current Pipeline's or stage's run has a "success" status, typically denoted by blue or green in the web UI.

unstable

Only run the steps in **post** if the current Pipeline's or stage's run has an "unstable" status, usually caused by test failures, code violations, etc. This is typically denoted by yellow in the web UI.

aborted

Only run the steps in **post** if the current Pipeline's or stage's run has an "aborted" status, usually due to the Pipeline being manually aborted. This is typically denoted by gray in the web UI.

Example

```
// Declarative //
pipeline {
  agent any
  stages {
    stage('Example') {
      steps {
        echo 'Hello World'
      }
    }
  }
  post { ①
    always { ②
      echo 'I will always say Hello again!'
    }
  }
}
// Script //
```

① Conventionally, the **post** section should be placed at the end of the Pipeline.

② **Post-condition** blocks contain **steps** the same as the **[steps]** section.

stages

Containing a sequence of one or more **[stage]** directives, the **stages** section is where the bulk of the "work" described by a Pipeline will be located. At a minimum it is recommended that **stages** contain at least one **[stage]** directive for each discrete part of the continuous delivery process, such as Build, Test, and Deploy.

Required	Yes
Parameters	<i>None</i>
Allowed	Only once, inside the pipeline block.

Example

```
// Declarative //
pipeline {
  agent any
  stages { ①
    stage('Example') {
      steps {
        echo 'Hello World'
      }
    }
  }
}
// Script //
```

① The **stages** section will typically follow the directives such as **agent**, **options**, etc.

steps

The **steps** section defines a series of one or more **steps** to be executed in a given **stage** directive.

Required	Yes
Parameters	<i>None</i>
Allowed	Inside each stage block.

Example

```
// Declarative //
pipeline {
    agent any
    stages {
        stage('Example') {
            steps { ❶
                echo 'Hello World'
            }
        }
    }
}
// Script //
```

❶ The **steps** section must contain one or more steps.

Directives

environment

The **environment** directive specifies a sequence of key-value pairs which will be defined as environment variables for the all steps, or stage-specific steps, depending on where the **environment** directive is located within the Pipeline.

This directive supports a special helper method **credentials()** which can be used to access pre-defined Credentials by their identifier in the Jenkins environment. For Credentials which are of type "Secret Text", the **credentials()** method will ensure that the environment variable specified contains the Secret Text contents. For Credentials which are of type "Standard username and password", the environment variable specified will be set to **username:password** and two additional environment variables will be automatically be defined: **MYVARNAME_USR** and **MYVARNAME_PSW** respective.

Required	No
Parameters	<i>None</i>
Allowed	Inside the pipeline block, or within stage directives.

Example

```
// Declarative //
pipeline {
    agent any
    environment { ❶
        CC = 'clang'
    }
    stages {
        stage('Example') {
            environment { ❷
                AN_ACCESS_KEY = credentials('my-prefined-secret-text') ❸
            }
            steps {
                sh 'printenv'
            }
        }
    }
}
// Script //
```

- ❶ An **environment** directive used in the top-level **pipeline** block will apply to all steps within the Pipeline.
- ❷ An **environment** directive defined within a **stage** will only apply the given environment variables to steps within the **stage**.
- ❸ The **environment** block has a helper method **credentials()** defined which can be used to access pre-defined Credentials by their identifier in the Jenkins environment.

options

The **options** directive allows configuring Pipeline-specific options from within the Pipeline itself. Pipeline provides a number of these options, such as **buildDiscarder**, but they may also be provided by plugins, such as **timestamps**.

Required	No
Parameters	<i>None</i>
Allowed	Only once, inside the pipeline block.

Available Options

buildDiscarder

Persist artifacts and console output for the specific number of recent Pipeline runs. For example:
options { buildDiscarder(logRotator(numToKeepStr: '1')) }

disableConcurrentBuilds

Disallow concurrent executions of the Pipeline. Can be useful for preventing simultaneous

accesses to shared resources, etc. For example: `options { disableConcurrentBuilds() }`

overrideIndexTriggers

Allows overriding default treatment of branch indexing triggers. If branch indexing triggers are disabled at the multibranch or organization label, `options { overrideIndexTriggers(true) }` will enable them for this job only. Otherwise, `options { overrideIndexTriggers(false) }` will disable branch indexing triggers for this job only.

skipDefaultCheckout

Skip checking out code from source control by default in the `agent` directive. For example: `options { skipDefaultCheckout() }`

skipStagesAfterUnstable

Skip stages once the build status has gone to UNSTABLE. For example: `options { skipStagesAfterUnstable() }`

timeout

Set a timeout period for the Pipeline run, after which Jenkins should abort the Pipeline. For example: `options { timeout(time: 1, unit: 'HOURS') }`

retry

On failure, retry the entire Pipeline the specified number of times. For example: `options { retry(3) }`

timestamps

Prepend all console output generated by the Pipeline run with the time at which the line was emitted. For example: `options { timestamps() }`

Example

```
// Declarative //
pipeline {
    agent any
    options {
        timeout(time: 1, unit: 'HOURS') ①
    }
    stages {
        stage('Example') {
            steps {
                echo 'Hello World'
            }
        }
    }
}
// Script //
```

- ① Specifying a global execution timeout of one hour, after which Jenkins will abort the Pipeline run.

NOTE | A comprehensive list of available options is pending the completion of [INFRA-1503](#).

parameters

The `parameters` directive provides a list of parameters which a user should provide when triggering the Pipeline. The values for these user-specified parameters are made available to Pipeline steps via the `params` object, see the [Example](#) for its specific usage.

Required	No
Parameters	<i>None</i>
Allowed	Only once, inside the <code>pipeline</code> block.

Available Parameters

string

A parameter of a string type, for example: `parameters { string(name: 'DEPLOY_ENV', defaultValue: 'staging', description: '') }`

booleanParam

A boolean parameter, for example: `parameters { booleanParam(name: 'DEBUG_BUILD', defaultValue: true, description: '') }`

Example

```
// Declarative //
pipeline {
    agent any
    parameters {
        string(name: 'PERSON', defaultValue: 'Mr Jenkins', description: 'Who should I
say hello to?')
    }
    stages {
        stage('Example') {
            steps {
                echo "Hello ${params.PERSON}"
            }
        }
    }
}
// Script //
```

NOTE | A comprehensive list of available parameters is pending the completion of [INFRA-1503](#).

triggers

The `triggers` directive defines the automated ways in which the Pipeline should be re-triggered. For Pipelines which are integrated with a source such as GitHub or BitBucket, `triggers` may not be necessary as webhooks-based integration will likely already be present. The triggers currently available are `cron`, `pollSCM` and `upstream`.

Required	No
Parameters	<i>None</i>
Allowed	Only once, inside the <code>pipeline</code> block.

cron

Accepts a cron-style string to define a regular interval at which the Pipeline should be re-triggered, for example: `triggers { cron('H */4 * * 1-5') }`

pollSCM

Accepts a cron-style string to define a regular interval at which Jenkins should check for new source changes. If new changes exist, the Pipeline will be re-triggered. For example: `triggers { pollSCM('H */4 * * 1-5') }`

upstream

Accepts a comma separated string of jobs and a threshold. When any job in the string finishes with the minimum threshold, the Pipeline will be re-triggered. For example: `triggers { upstream(upstreamProjects: 'job1,job2', threshold: hudson.model.Result.SUCCESS) }`

NOTE | The `pollSCM` trigger is only available in Jenkins 2.22 or later.

Example

```
// Declarative //
pipeline {
  agent any
  triggers {
    cron('H */4 * * 1-5')
  }
  stages {
    stage('Example') {
      steps {
        echo 'Hello World'
      }
    }
  }
}
// Script //
```

stage

The **stage** directive goes in the **stages** section and should contain a **[steps]** section, an optional **agent** section, or other stage-specific directives. Practically speaking, all of the real work done by a Pipeline will be wrapped in one or more **stage** directives.

Required	At least one
Parameters	One mandatory parameter, a string for the name of the stage.
Allowed	Inside the stages section.

Example

```
// Declarative //
pipeline {
  agent any
  stages {
    stage('Example') {
      steps {
        echo 'Hello World'
      }
    }
  }
}
// Script //
```

tools

A section defining tools to auto-install and put on the **PATH**. This is ignored if **agent none** is specified.

Required	No
Parameters	<i>None</i>
Allowed	Inside the pipeline block or a stage block.

Supported Tools

maven

jdk

gradle

Example

```
// Declarative //
pipeline {
    agent any
    tools {
        maven 'apache-maven-3.0.1' ❶
    }
    stages {
        stage('Example') {
            steps {
                sh 'mvn --version'
            }
        }
    }
}
// Script //
```

❶ The tool name must be pre-configured in Jenkins under **Manage Jenkins** → **Global Tool Configuration**.

when

The **when** directive allows the Pipeline to determine whether the stage should be executed depending on the given condition. The **when** directive must contain at least one condition. If the **when** directive contains more than one condition, all the child conditions must return true for the stage to execute. This is the same as if the child conditions were nested in an **allOf** condition (see the [examples](#) below).

More complex conditional structures can be built using the nesting conditions: **not**, **allOf**, or **anyOf**. Nesting conditions may be nested to any arbitrary depth.

Required	No
Parameters	<i>None</i>
Allowed	Inside a stage directive

Built-in Conditions

branch

Execute the stage when the branch being built matches the branch pattern given, for example: **when { branch 'master' }**. Note that this only works on a multibranch Pipeline.

environment

Execute the stage when the specified environment variable is set to the given value, for example: **when { environment name: 'DEPLOY_TO', value: 'production' }**

expression

Execute the stage when the specified Groovy expression evaluates to true, for example: `when { expression { return params.DEBUG_BUILD } }`

not

Execute the stage when the nested condition is false. Must contain one condition. For example: `when { not { branch 'master' } }`

allof

Execute the stage when all of the nested conditions are true. Must contain at least one condition. For example: `when { allof { branch 'master'; environment name: 'DEPLOY_TO', value: 'production' } }`

anyOf

Execute the stage when at least one of the nested conditions is true. Must contain at least one condition. For example: `when { anyOf { branch 'master'; branch 'staging' } }`

Examples

Single condition

```
// Declarative //
pipeline {
  agent any
  stages {
    stage('Example Build') {
      steps {
        echo 'Hello World'
      }
    }
    stage('Example Deploy') {
      when {
        branch 'production'
      }
      steps {
        echo 'Deploying'
      }
    }
  }
}
// Script //
```

Multiple condition

```
// Declarative //
pipeline {
  agent any
  stages {
    stage('Example Build') {
      steps {
        echo 'Hello World'
      }
    }
    stage('Example Deploy') {
      when {
        branch 'production'
        environment name: 'DEPLOY_TO', value: 'production'
      }
      steps {
        echo 'Deploying'
      }
    }
  }
}
// Script //
```

Nested condition (same behavior as previous example)

```
// Declarative //
pipeline {
  agent any
  stages {
    stage('Example Build') {
      steps {
        echo 'Hello World'
      }
    }
    stage('Example Deploy') {
      when {
        allof {
          branch 'production'
          environment name: 'DEPLOY_TO', value: 'production'
        }
      }
      steps {
        echo 'Deploying'
      }
    }
  }
}
// Script //
```
